Intergovernmental Affairs
Government of Ontario**

INTRODUCTION

This document contains the supplementary material to Ontario Tax Study 7, Analysis of Income and Property Taxes in Guelph. It contains the manuals for three computer models:

'Repcred': the representative taxfiler analysis for property and sales tax credits.

'Provcrcd': the analysis of the revenue and incidence effects of property and sales tax credits in Ontario.

'Guelphcred': the analysis of the revenue and incidence effects of tax credits in Guelph.

Additional copies are available from the Taxation and Fiscal Policy Branch, Ministry of Treasury, Economics and Intergovernmental Affairs, Ontario.

D PROGRAM LISTING

I. INTRODUCTION

This program has been designed to examine the implications of various possible forms of tax credit scheme. It is currently restricted to the examination of sales and property tax credits, but could, with a little modification, be used to examine possible credits for medicare payments.

The program provides for the analysis of a number of possible formulations of a property tax credit as well as facilitating an examination of the implications of various possible sets of parameters.

The sales tax credit formula is related uniquely to one form of the property tax credit - the form proposed at the Finance Ministers meeting in Ottawa, November 1-2, 1971.

The program provides for examination of a property tax exemption formula, as well as a formula, similar to the then existing basic shelter grant program.

The primary purpose of this program is to examine and compare the incidence effects of alternative formulae and alternative sets of parameters.

Following the selection of a particular formula and parameter set, it may also be used as a reference for advising individuals of their prospective benefits under the scheme.

II. DESCRIPTION OF PROGRAM.

The program analyzes the incidence effects of alternative tax allowance formulae assuming the application of the new Income Tax Act - Bill C-259.

The rate schedule used is that initially proposed in Bill C-259 for 1972 assuming a combined federal and 30 per cent provincial tax.¹

The program provides for the optional inclusion in the analysis of the new allowances under Bill C-259: the employment expense allowance; the child care allowance; the new personal exemption levels for singles, marrieds and old people; charitable deductions; the standard \$100 deduction; and contributions to registered retirement pension funds.

The program generates a matrix of results by gross income and property tax class. It examines up to 40 income classes and 30 property tax classes. Tables are generated for the following values: total income and property tax payable before tax credit formula is applied; difference in taxes produced by the credit formula (including refunds where applicable); the credit as a per cent of gross income; property tax as a per cent of gross income; total tax as a per cent gross income; and total tax less credit as a per cent gross income.

1. See: Hon. E. J. Benson, Summary of 1971 Tax Reform Legislation (Ottawa: Department of Finance, 1971), page 17.

The program analyzes several broad categories of credit formulae: tax credits related solely to income (either taxable income or gross income); credits related solely to actual levels of property tax (such as the existing basic shelter exemption grant); credits related to both property tax and income; and a property tax exemption - which alters the tax base rather than the level of taxes to be paid or refunded.

III. APPLICATION OF PROGRAM TO ANALYSIS.

The primary purpose of this program is to examine the incidence effects of various tax credit formula for representative taxfilers. It examines the incidence for various possible combinations of personal exemptions, deductions and allowances.

The program facilitates the first stage in designing a credit formula. A full analysis requires knowledge of the incidence of property taxes by income classes and a costing of the revenue foregone in the province under various formula.

The computer model was designed using the time sharing computer facilities of Polycom Limited, Toronto which has a General Electric 400 series computer.

Appendix A

TABLES GENERATED

SUMMARY.

A run of the program generates an analysis of the effects of the particular credit formula chosen for income filers with a given set of personal exemptions and deductions. Thus, for a run which assumes an individual files as single with no dependents, the effects of the credit are demonstrated for various combinations of gross income and property tax. Each set of personal exemption and dependency characteristics requires a separate run.

The output of a run is prefaced with a listing of the parameter values of the particular credit form being tested as well as a summary of the assumed filer exemption characteristics.

TABLES.

- A.1 Sum of income and property tax payable before credit.
- A.2 Difference in taxes after credit: value of credit (may be refundable).
- A.3 Difference in taxes as per cent of gross income.
- A.4 Property tax as per cent gross income.
- A.5 Net property tax as per cent gross income (property tax less total credit).
- A.6 Total tax as per cent gross income (total tax is sum of income and property taxes).
- A.7 Total tax less credit as per cent gross income.

Appendix B

TAX SYSTEMS ANALYZED

B.1 POSSIBLE FORMS OF THE TAX CREDIT

(i) Income Related Credits

A basic credit reduced by some fraction of either gross or taxable income.

$$\text{CREDIT} = \text{BASIC CREDIT} - a_1 Y$$

where Y may be either gross or taxable income

A rule may be adopted that the basic credit is reduced by some fraction of income only after some minimum level of income has been reached.

(ii) Property Tax Related Credits

a) Similar to current basic shelter exemption:

A basic credit increased by some fraction of the average net assessment of the municipality.

$$\text{CREDIT} = \text{BASIC CREDIT} + a_2 A$$

where A is average net assessment of the municipality

A rule may be adopted that if the calculated credit exceeds the basic credit, then the credit is reduced to equal either the basic credit or one-half the property tax whichever is the greater.

b) Related to personal property tax paid:

A basic credit increased by some fraction of property tax paid.

$$\text{CREDIT} = \text{BASIC CREDIT} + a_3 * \text{PROPERTY}$$

A rule may be adopted that the credit does not exceed some fixed upper level. (It should be possible to ascertain at what gross income the limit will usually become operative).

(iii) Credits Related to Both Property Tax and Income

- a) A basic credit increased by some fraction of property tax and reduced by some fraction of either gross or taxable income.

$$\text{CREDIT} = \text{BASIC CREDIT} + a_4 \text{ PROPERTY TAX} - a_5 Y$$

where Y is either gross or net income

A rule may be adopted that there be an upper ceiling on the tax. Or, if gross income is adopted, a_5 may be set such that for average taxes for any income level, the credit works out at no more than the basic credit for that group. Thus, those who pay more than average property taxes in their income group will obtain a proportionately greater tax credit. The floor on the credit would be the basic credit level, or some fraction of it.

- b) No basic credit and credit calculated as some fraction of property tax reduced by a factor which is itself variable. The factor is the fraction of property tax already calculated divided by some constant.

$$\begin{aligned} \text{CREDIT} &= a_6 \text{ PROPERTY TAX} \left(1 - \frac{Y}{\text{Constant}}\right) \\ &= a_6 \text{ PROPERTY TAX} - \frac{a_6 \text{ PROPERTY TAX}}{\text{CONSTANT}} * Y \end{aligned}$$

where Y is either gross or taxable income

- c) No basic credit and credit calculated as some fraction of property tax reduced non-linearly by income. (parabolic function).

$$\begin{aligned} \text{CREDIT} &= a_6 \text{ PROPERTY TAX} \left(1 - \frac{Y}{\text{CONSTANT}}\right)^2 \\ &= a_6 \text{ PROPERTY TAX} - \frac{2 * a_6 \text{ PROPERTY TAX}}{\text{CONSTANT}} * Y^2 \end{aligned}$$

where Y is either gross or taxable income.

B.2 PROPERTY TAX EXEMPTION

Provision to reduce property tax burdens may, in principle, be done with a special exemption. This, however, reduces the benefits of the scheme for those whose exemptions already approach to exceed their gross income.

B.3 SALES TAX CREDIT

The model will analyze one form of sales tax credit in conjunction with a credit related to both property tax and taxable income.

B.4 SELECTION CODE FOR ALLOWANCE FORMULAE

Credit Systems:

NN = 1

$$\text{CREDIT} = \text{BASIC CREDIT} - a_1 (Y - \text{PTP})$$

where Y = TAXABLE INCOME

$$\text{PTP} = \text{LEVEL OF EXEMPT TAXABLE INCOME (PTP} \geq 0)$$

$$a_1 = \text{INCP}$$

NN = 2

$$\text{CREDIT} = \text{BASIC CREDIT} + a_2 A$$

where A = average net property tax of municipality

Set PTP = A

$$a_2 = \text{CRED}$$

(SEE NOTE)

NN = 3

CREDIT = BASIC CREDIT + a_4 PROPERTY TAX - $a_5 Y$

where Y = TAXABLE INCOME

a_4 = CRED

a_5 = INCP

NN = 4

CREDIT = BASIC CREDIT + a_3 PROPERTY TAX

where a_3 = CRED

(SEE NOTE)

NN = 5

$$\text{CREDIT} = \text{BASIC CREDIT} - a_1 (Y - \text{PTP})$$

where $Y = \text{GROSS INCOME}$ ($\text{PTP} \geq 0$)

$$a_1 = \text{INCP}$$

(COMPARE WITH NN = 1)

Exemption System:

NN = 6

$$\text{EXEMPTION} = \text{BASIC EXEMPTION} - \text{INCP} * Y$$

where $\text{BASIC EXEMPTION} = \text{BCRED}$

$$\text{GROSS INCOME} = Y$$

Note: When NN = 2, if the calculated credit exceeds one half the property tax, the credit is calculated as one half of property tax.

When NN = 4, if the calculated credit exceeds some upper limit, PTP, it is set equal to the upper limit.

B.5 FORTRAN VERSION OF ALLOWANCE FORMULAE

NN = 1

$$\text{CD(I)} = \text{BCRED} - \text{INCP} * (\text{I}) - \text{PTP}$$

$$\text{if } \text{CD(I)} \leq \text{FP} * \text{BCRED}, \text{CD(I)} = \text{FP} * \text{BCRED}$$

NN = 2

$$\text{CD(J)} = \text{BCRED} + \text{CRED} * \text{PTP}$$

$$\text{if } \text{CD(J)} \geq .5 * \text{PTAX(J)}, \text{CD(J)} = .5 * \text{PTAX(J)}$$

NN = 3

TTT(I,J) = BCRED + CRED *PTAX(J) - INCP*TTINC(I,J)

NN = 4

CD(J) = BCRED + CRED*PTAX(J)

if CD(J).GE.PTP, CD(J) = PTP

NN = 5

CD(I) = BCRED - INCP*(XINC(I) - PTP)

if CD(I).LE.FP*BCRED, CD(I) = FP*BCRED

NN = 6

CD(I) = BCRED - INCP*XINC(I)

if CD(I).GT.PTP, CD(I) = PTP

TINC (I) = TINC (I) - CD(I)

Note: NN = 6 is the exemption scheme - the exemption is subtracted from taxable income and the rate schedule applied to the resulting net income.

Appendix C

PROGRAM PARAMETERS

C.1 SUMMARY.

The program reads a datafile in the course of each run. This specifies the credit formula, parameters, the filer's exemption characteristics and the set of income and property tax classes to be analyzed.

C.2 FORMAT OF THE DATAFILE.

<u>"Read"</u> <u>Statement</u> <u>No.</u>	<u>Variable</u> <u>Symbol</u>	<u>Description</u>
1	NN	Credit or exemption formula - see Appendix B for specification.
	N1	Child care allowance: 0 if no child care; otherwise 1.
	N2	Sales tax credit: 0 if no sales credit; otherwise 1.
	N3	Registered pension plan deduction: 0 if not analyzed; otherwise 1.
2	M	No. of income classes.
	N	No. of LIA, RTC classes.
	K	0 if single; 1 if married.
	KK	No. of children under 16.
	L	No. of children under 14.
	LL	No. of children 16 or over.
	LLL	0 if filer under 65 years old; otherwise 1.

	MM	Employment expenses: 0 or number claimed.
3	EXE	Maximum employment expenses.
	EXA	Old age \$650 deduction.
	EXPI	Single exemption.
	EXP2	Married exemption.
4	DEM	Standard \$100 deduction
	DECH	20 per cent charitable deduction.
	EXCH1	Exemption for children under 16.
	EXCH2	Exemption for children over 16.
5	DECAR	Maximum day-care allowance - \$2,000.
	DECARL	Assumed level of day care per child.
	DECAM	Fraction of income which may be subtracted for day care.
6	CRED	Credit as % property tax.
	BCRED	Basic property tax credit
	INCP	Income coefficient.
	PTP	Maximum credit permitted.
	FP	Minimum credit allowed.
7	XINC	Income classes.
8	ARSH	Average taxes.
9	RSH	Marginal tax rate.
10	PTAX	Property tax levels.

11	RTC	Refundable tax credit classes.
12	LIA	Low income allowance classes.

I INTRODUCTION

This program is designed to examine the revenue and incidence effects of possible sales and property tax credit formulae in Ontario. The analysis may be conducted within three economic frameworks and under two tax systems. The alternative economic frameworks are: the year of the data base (1968); and, 1972 and 1973, assuming plausible economic environments. The alternative tax systems are: the tax system which existed up to December 31, 1971, and, the new tax system introduced by Bill C-259 taking effect January 1, 1972.

The program yields estimates of the total cost of specified credit formulae under the assumed economic environment and tax system as well as an analysis of the cost and incidence of the formulae by gross income and family dependency classes.

The incidence of property taxes by income class is derived from the analysis of Guelph income and property tax records. The Guelph results are normalized to the provincial level.¹

-
1. See: Brian Hull, GUELPHCRED: Manual for the Analysis of the Revenue and Incidence Effects of Tax Credits in Guelph (Toronto: Ministry of Treasury, Economics and Intergovernmental Affairs, 1972), mimeo; and, Staff Study, Analysis of Income and Property Taxes in Guelph, (Toronto: Ministry of Treasury, Economics and Intergovernmental Affairs, 1972).

II DESCRIPTION OF PROGRAM

The specification of the tax system analyzed and the economic environment is done within the body of the program using switches. The credit system employed must be specified with the appropriate function at the point in the program where the analysis of the credit takes place.

The sales tax credit is a function of the number of members of the household and taxable income.¹ Tax returns filed claiming a married exemption are assumed to correspond to a unique household. However, in households where both spouses work and each earns more than \$1,600 (under the new tax act), both file as single. In addition, students with temporary membership in the work force who continue to live at home are still members of their parental household. (The exceptions are students who either alone or in groups may rent accommodation apart from official school residences. Such groups, occupying separately assessed residential units, would be classified as households.) Thus, the proportion of single taxfilers who constitute unique households is very substantially less than the proportion of married ones.

1. See: Hon. W. Darcy McKeough, "Preliminary Outline of a System of Property and Sales Tax Credits for Ontario Taxpayers," Meeting of Ministers of Finance, Ottawa, November 1-2, 1971 (Toronto: Department of Treasury and Economics), mimeo.

As the sales tax credit depends upon size of household, and as the proportion of households among filers who file as married is nearly one - while the proportion among those who file as single is much less than one - a classification of tax returns by personal exemption class as well as by gross income class, is required.

In the "Green Book", Taxation Statistics, this information is provided only on a Canada basis. It is thus necessary to employ adjustment factors to reduce the Canada data to a provincial basis. This is done within the program both for numbers of taxfilers and taxable income.

The estimated number of returns and amount of taxable income in each personal exemption class is summed up and adjusted by a factor which brings the total to the known Ontario total in the base year. The number of returns and taxable income are projected to 1972 and 1973 by factors whose derivation is discussed in Appendix B.1.

Two methods are used for deriving taxable income under the new tax act, Bill C-259. The first allows only for the change in personal exemptions. The second employs the average change in the tax base by income tax class, as indicated by the GITAN analysis conducted within a similar economic framework. The procedure is discussed more fully in Appendix B.2.¹

1. Ontario Studies in Taxation Nos. 1, 2 and 4 employ the GITAN program as modified and developed by the Ontario Treasury.

III APPLICATION OF PROGRAM TO ANALYSIS

The principal purpose of this program is to provide a guide to the revenue implications of alternative formulae. The estimates of the model must be accepted within fairly broad confidence intervals. The extrapolation procedure is much more rudimentary than that employed in Ontario Studies in Tax Reform, No. 4. The exact number of households is difficult to estimate. From the total of residential properties assessed for taxation, must be subtracted summer cottages and vacation homes, residences whose occupants file an income tax return in some other jurisdiction, and vacant lots. An estimate of the number of roomers and boarders now eligible must be added.

Appendix A

TABLES GENERATED

SUMMARY.

A run of this program analyzes the revenue and incidence effects of the proposed credit formula for various target years. The data base for runs to date of issue of this manual is 1968. The data is from the Taxation Green Book and is classified by gross income and dependency filing characteristics for each taxfiler.¹ These tables are on a Canada basis and are adjusted to an Ontario basis using the ratio of taxfilers and taxable income by income class for Ontario and Canada.

Property taxes for each income class are derived from the Guelph analysis of matched income tax and property tax records. The property tax figures are the average level for each income class adjusted for the ratio of average provincial property taxes to average Guelph property taxes.

The advantage of the particular grouping of the data employed is that it makes explicit the degree to which family circumstances (number of dependents) affect the value of the credit for taxfilers assumed to be bearing the same level of property taxes. It also a necessary grouping for calculating

1. Table 7A, All returns by marital status, dependents and income Taxation Statistics (Ottawa: Department of National Revenue, Taxation, edition 1970) p.104 and following.

the value and incidence of a sales tax credit assumed to be \$10 for each member of a family, reduced by 1 per cent of taxable income.

Appendix B

TAX SYSTEMS ANALYZED

B.1 SUMMARY

The provincial credit analyzer estimates the cost and incidence of various possible credit formulae using 1968 data.

The analysis may be conducted for 1968, 1972 and 1973 under both the old tax act and the act adopted in December 1971, C-259.

The modification of the tax base to represent the base under Bill C-259 may be done by either of two procedures:

1. reducing the tax base by the increase in exemptions for singles and marrieds only.
2. altering the tax base by the percentage difference in the tax base under the old and new tax systems (by income class) as indicated by provincial runs of GITAN within the same economic environment.

The total cost of both a sales tax credit and a property tax credit formula is very nearly the same, whichever procedure is used.

The extrapolation of the analysis from the 1968 data base is undertaken with the very simplest possible procedure. The number of taxfilers between 1968 and 1972 increases at the

level projected for Ontario in the GITAN analysis. The number of taxfilers in each income, dependency class cell is increased by this factor. Between 1968 and 1972 the number of taxfilers in Ontario is estimated to increase by slightly more than the national average.

Income in Ontario is assumed to change between 1968 and 1972 by a factor which adopts the forecast performance of the Ontario economy in 1972.¹ Taxable income in Ontario increases more rapidly than income itself and this is allowed for in the analysis.

	1972/1968
Increase in total income	1.44717
Increase in no. of taxfilers	1.18893
Ratio of taxable income to total accrued income: ²	
1968 Old tax base	.5011
New tax base	.4104
1972 Old tax base	.5747
New tax base	.5014

Taxable income for 1972 is then multiplied by a factor which is the increase in total income times the increased share of taxable income $(1.44717 * ((.5014/.4104)) = 1.76805)$.

1. Canadian and Ontario Economic Forecast (Toronto: Dept. of Treasury and Economics, Fall, 1971).

2. These ratios are based on GITAN runs for 1968, 1972 CANADA basis. That is GITAN, Level 7.2 runs 1968, 7:409; 1972, 7:420. This GITAN analysis is based on the same forecast as that used in this study.

The extrapolation procedure for the economic environment used in this analysis is the same as that used in the Guelph Analyzer.

Property taxes by income class are the average by income class for Guelph in 1968, normalized to the provincial level. See B.4 for a discussion of property tax level extrapolation.

B.2 NEW TAX ACT.

Two methods are used to estimate the tax base under C-259: 1, the change in exemption procedure; 2, the GITAN procedure.

1. Under the exemption procedure, the tax base is reduced by the increase in exemptions for singles and married taxfilers. Taxable income for taxfilers filing as single is reduced by the increase in the single exemption times the number of taxfilers filing as single. Taxable income for taxfilers filing as married is reduced by the increase in the married exemption times the number of taxfilers.

2. With the GITAN method, the taxable income by income class is multiplied by the ratio of taxable income under the new and old systems for the appropriate year.

Gross Income Class	Ratio of New Tax Base to Old	
	<u>1968</u>	<u>1972</u>
\$ 0 - 2,000	2.687	7.309
2,000 - 3,000	.395	.568
3,000 - 4,000	.649	.697
4,000 - 5,000	.731	.791
5,000 - 6,000	.793	.833
6,000 - 8,000	.854	.889
8,000 - 10,000	.892	.922
10,000 - 25,000	.963	.953
25,000 and over	1.067	1.0626

Source: GITAN runs 7:409 and 7:20, Ontario. Note in 1968 and 1972 taxable income under \$2,000 is an increase in a negative amount.

Factors for GITAN method used in program income classes:

Gross Income Class	Ratio of New Tax Base to Old	
	<u>1968</u>	<u>1972</u>
\$ 0 - 2,500	0	0
2,500 - 3,000	.395	.568
3,000 - 3,500	.649	.697
3,500 - 4,000	.649	.697
4,000 - 4,500	.731	.791
4,500 - 5,000	.731	.791
5,000 - 5,500	.793	.833
5,500 - 6,000	.793	.833
6,000 - 6,500	.854	.889
6,500 - 7,000	.854	.889
7,000 - 7,500	.854	.922
7,500 - 8,000	.854	.922
8,000 - 8,500	.892	.953
8,500 - 9,000	.892	.953
9,000 - 9,500	.892	.953
9,500 - 10,000	.892	.953
10,000 - 25,000	.963	1.063
25,000 and over	1.067	1.572

The changed exemption method analyzes only one of the significant differences between the old and new tax acts. It does represent, however, the biggest modification in the tax base. The changes in the tax base produced by the GITAN method is the net effect of all the alterations in the tax base produced by the new tax act.

Thus, the GITAN method includes the net effect of the following alterations:

1. changed exemptions for singles and marrieds.
2. dividend tax credit.
3. standard employment expense allowance.
4. top employee benefits.
5. deductibility of U.I.C. contributions.
6. attribution to employees of employer medicare contributions.
7. taxation of U.I.C. benefits.
8. sickness and accident benefits from private plans.
9. inclusion of scholarship and fellowship income and special student allowance.
10. changed definition of medical expenses.

These factors do not include the effects of the capital gains tax.

B.3 HOUSEHOLD POPULATION.

In 1968, there were 3.366 million tax returns filed in Ontario, of which .522 million constituted untaxable returns.¹ For that year, the Ontario Department of Municipal Affairs reports that there were 2.173 million households assessed for residential and farm taxes.² A household for tax purposes must be distinguished from a more behaviourally defined, socio-economic household. More than one "family" may share living quarters assessed as a separate unit, and, a "family" may have more than one dwelling, ski chalet, cottage, etc., each of which is separately assessed as a household for tax purposes. In addition, many vacant lots, zoned for residential housing, are counted as separately assessable units and counted as "households".

	1968	1972
Number of tax returns	3.345 m.	3.977 m.
Number of households	2.173 m.	
Number of households in analysis	2.172 m.	2.583 m.

Number of Households
for Residential and Farm Tax Purposes.
million

1968	2.172
1969	2.236
1970	2.400 ³

1. See Taxation Statistics, (Ottawa: Dept. of National Revenue, Taxation, 1970 edition), Table 1, p.15.
2. Hon. W. Darcy McKeough, 1968 Summary of Financial Reports of Municipalities, (Toronto: Dept. of Municipal Affairs, 1969).
3. Hon. W. Darcy McKeough, Summary of Financial Reports of Municipalities, op.cit., 1968 and 1969 editions, and Department of Municipal Affairs.

The actual number of principal householders expected under the tax credit must be the total reduced by the number of second establishments in the Province (primarily cottages) and increased by the anticipated increase in claims from roomers and boarders and tenants. Both of these factors are, to some extent, judgmental and estimated from other sources. An allowance for them should be made after the other analysis is completed.

The analysis implies a 3.75 per cent increase in the household population in 1971 and 1972. This compares with an increase of 2.95 per cent between 1968 and 1969, and of 7.33 per cent between 1969 and 1970.

For purposes of estimating the cost of the sales tax credit the full taxfiling population is used. To estimate the revenue cost of the property tax credit, only the household population, as defined above, is used. The derivation of the household population from the taxfiling population is explained below.

The analysis assumes that all tax returns filed with a married tax exemption constitute a household for purposes of the property tax credit. It further assumes that 95 per cent of those who file as single and claim at least one dependent constitute a household for purposes of the credit. The population of those who file as single with no dependents is reduced by the following factors:

Adjustment Factors From
Taxfiler to Household Basis
for Taxfilers Filing
as Single with No Dependents.

Gross Income Class	
0 - 2,500	.1710
2,500 - 3,000	.2281
3,000 - 3,500	.2851

PROGRAM PARAMETERS

C.1 VARIABLES.

XTRO(20)	=	No. of taxfilers with taxable returns, ONTARIO.
TINCO(20)	=	Total income, ONTARIO
TBLO(20)	=	Taxable income, ONTARIO
TXO(20)	=	Total tax, ONTARIO
XNTR(20)	=	Number of tax returns, CANADA
XARO(20)	=	Total taxfilers, all returns, ONTARIO
VABLO(20)	=	Total taxable income, all returns, ONTARIO
TAX(20)	=	Total tax, all returns, CANADA
D(20, 8)	=	No. of tax returns, CANADA, in each personal exemption class
TT(20, 8)	=	Taxable income, for each personal exemption class, CANADA
PNTR(20)	=	Ratio, all ONTARIO taxfilers, to all CANADIAN taxfilers
ATO(20)	=	Not used
STT(20)	=	Sum of taxable income by income class
PTBO(20, 8)	=	Ratio, all ONTARIO taxable income to all CANADIAN taxable income
SM(8)	=	Sum of taxable income by exemption class
SD(8)	=	Sum of returns, by exemption class
TB(20, 8)	=	Taxable income by income and dependency class, ONTARIO

SDI(20)	=	Sum of returns by income class
SC(20, 8)	=	Cost of credit by personal exemption class and income
SNTR	=	Sum of returns, CANADA
STRO	=	Sum of taxable returns, ONTARIO
STBO	=	Sum of taxable income, ONTARIO
SINO	=	Sum of total income, ONTARIO
STO	=	Sum of total tax, ONTARIO
DELS	=	Increment in single exemption, new bill
DELM	=	Increment in married exemption, new bill
CSUM	=	Total cost, property tax credit
TSC	=	Total cost, sales tax credit
HSUM	=	Total number of households
TBS8(20)	=	GITAN adjustment factors of taxable income, 1968
TBS2(20)	=	GITAN adjustment factors of taxable income, 1972.

C.2 FORMAT OF DATAFILE.

Variables are read in from the datafile in the following order:

XTRO	=	No. of taxfilers with taxable returns, ONTARIO
TINCO	=	Total income, ONTARIO
TBLO	=	Taxable income, ONTARIO
TXO	=	Total tax, ONTARIO
XNTR	=	Number of tax returns, CANADA
XARO	=	Total taxfilers, all returns, ONTARIO
XABLO	=	Total taxable income, all returns, ONTARIO
TXO	=	Total tax, all returns, ONTARIO
D	=	No. of tax returns, CANADA
TT	=	Taxable income, for each personal exemption class, CANADA
PTX	=	Average level of property tax by gross income class.

C.3 CLASSIFICATION OF DATA

Data is classified by gross income and dependency class.

The family status (dependency) classification is as follows:

Single ,	no dependents
"	one or more dependents
Married,	no dependents
"	one dependent
"	two dependents
"	three "
"	four "
"	five or more dependents.

The gross income classes used in the analysis are as follows:

\$	0 -	2,500
	2,500 -	3,000
	3,000 -	3,500
	3,500 -	4,000
	4,000 -	4,500
	4,500 -	5,000
	5,000 -	5,500
	5,500 -	6,000
	6,000 -	6,500
	6,500 -	7,000
	7,000 -	7,500
	7,500 -	8,000
	8,000 -	8,500
	8,500 -	9,000
	9,000 -	9,500
	9,500 -	10,000
	10,000 -	25,000
	25,000 and over.	

Information is aggregated up to \$2,500 in all arrays where the GREEN BOOK gives a finer breakdown. Similarly, because not all arrays break down information between \$10,000 and \$25,000 this information is aggregated within the program.

I. INTRODUCTION

The Guelph Tax Analyzer Model is an addition to the growing number of computer simulation models employed in the development and testing of proposed and legislated modifications to the personal income tax structure.^{.1} Since 1969, tax analysis through computer simulation has become a routine element in the process of policy development and monitoring carried on within the Ontario Treasury.^{.2}

The Guelph Model was designed for the purpose of testing alternative approaches to the integration of property taxes and income taxes through the device of tax credits. It is unique in its integration of property tax and income tax records. It examines the detailed incidence of property taxes and the redistributive effects of alternative tax credit formulae. For purposes of designing the property tax credit, the incidence of

1. The earliest models in this field were: John Bossons, "A General Income Tax Analyzer", Royal Commission on Taxation, Staff Study 25, (Ottawa: Queen's Printer, 1967) and Joseph A. Pechman, "A New Tax Model for Revenue Estimating", in Alan T. Peacock and Gerald Hauser, editors, Government Finance and Economic Development (Paris: O.E.C.D., 1965).
2. Analysis of the Federal Tax Reform Proposals, Ontario Studies in Tax Reform 1 (Toronto: Department of Treasury and Economics, 1970): Effects of Ontario's Personal Income Tax Proposals, Ontario Studies in Tax Reform 2 (Toronto: Department of Treasury and Economics, 1970): and Tax Reform and Revenue Growth to 1980, Ontario Studies in Tax Reform 4 (Toronto: Department of Treasury and Economics, 1971).

property taxes was examined for the principal income recipient in each household. Further examination of property tax incidence was done for household income and by age group. This extensive analysis of the incidence of property taxes has provided valuable information on the pattern of housing consumption.

The large variance in property tax level makes knowledge of the range of relief which a particular credit formula would make available to heads of household with similar levels of current income especially important. The Guelph Model marks a further step towards a capability to analyze the total burden of taxes by income class along the lines of Richard Musgrave's path-
3
breaking work of 1951.

-
3. Richard A. Musgrave, "Distribution of Tax Payments by Income Groups: A Case Study for 1948", National Tax Journal, March, 1951, pp. 1-53. Such an application of the computer simulation approach is proposed by Joseph A. Pechman in "A new Tax Model for Revenue Estimating", op. cit. p. 240.

II. DESCRIPTION OF PROGRAM

The Guelph Analyzer Model is a computer model designed to examine the incidence of residential property taxes in Guelph and test the redistributive effects of alternative tax credit formulae.

The model uses the individual tax records for residents of Guelph in 1968. These were stored on computer tape in the provincial master file and matched with the corresponding assessment records of the City of Guelph. The Guelph assessment information was recorded on computer tape following complete re-assessment at market values of the residential properties in the municipality. The joining of an individual income tax return to the corresponding assessment record was done by a computer program which ensures the complete anonymity of the individuals whose records are used in the analysis.

Income taxes are examined under the provisions of the Income Tax Act as it existed up to December 1971 (omitting the special in-year tax reduction of 3 per cent) and under the new tax act which came into effect January 1972. The analysis is conducted for 1968, the year for which the data is derived and for 1972. There is no distinction in the analysis between properties which are owner-occupied and those which are rented. The results indicated both the incidence of property taxes and the impact effects of the property tax credit. The final incidence of the property tax credit depends on how housing prices are affected by the change from a uniform

exemption per household to tax relief dependent upon both income
1
and property taxes paid.

The method used in this study is analogous to that employed
2
in earlier studies in this series. In examining the current tax
system, the model allows for the change in personal exemptions, the
major alternation in the tax base between it and the former system.
The model also allows for the change in the dividend tax credit but
because of data limitations in the master taxfile, does not include
3
other modifications in the tax base.

-
1. Under conditions where the withdrawal of the basic shelter exemption reduces the price of supermarginal houses proportionately to the decrease in price of marginal houses, the final incidence of the removal of the basic shelter allowance is on the occupier, whether he is the owner or the tenant. Quantitative assessments of the difference between the final incidence of a tax charge on owners and tenants have not been attempted. See Herbert A. Simon, "The Incidence of a Tax on Urban Real Estate", page 428 in Richard A. Musgrave and Carl S. Shoup, Readings in the Economics of Taxation (Homewood: Richard Irwin Inc., 1959).
 2. See: Analysis of the Federal Tax Reform Proposals, op. cit.; Effects of Ontario's Personal Income Tax Proposals, op. cit.; and Tax Reform and Revenue Growth to 1980, op. cit.
 3. In the analysis of the current tax system, the differences between it and the former system which have not been taken into account are: the standard employee expense allowances; deductibility of U.I.C. contributions and taxation of U.I.C. benefits; attribution of employee medical contributions and sickness and accident benefits from private plans; the changed definition of medical expenses; and the inclusions of scholarship and fellowship income and the special student allowance.

The Data Base

In 1968, there were 15,407 residential properties in Guelph.⁴ In the match of income tax and property assessment records, it was possible to identify 8,779 of the properties and assign to them the tax returns of the occupants. For about 3,235, identification was impossible. These properties were not labelled by an individual name but were described as vacant lots or vacant dwellings, called "owner-occupied", owned by companies or lots "owned by listed tenants". The balance of 3,393 could not be matched because surnames on the income tax and assessment records did not correspond for a given address. This group accounts for about 22 per cent of the total. As about a fifth of all households change address every year, most of this mismatch is due to removals and some is caused by inconsistent spelling of names between property assessment and income tax records. As both owner-occupied and rental accommodation are assessed at market value in Guelph, this study does not distinguish between the two forms of tenure. The matched records include those for both owner-occupied and rented accommodation.

The Extrapolation from 1968 to 1972

In extrapolating the 1968 data base to 1972, the simplest procedure was used. The master taxfile from which the Guelph income tax records are taken contains information in a more summary form than does the intensive sample used for compilation of Taxation⁵ Statistics.

-
4. Blue Book: 1968 Summary of Financial Reports of Municipalities (Toronto: Department of Municipal Affairs, 1968), page 1.
 5. Taxation Statistics. Ottawa: Department of National Revenue: Taxation, 1970 Edition.

The detailed information of the intensive sample makes possible the relatively complex extrapolation procedure employed in Tax Reform and Revenue Growth to 1980. However, the intensive sample does not include surnames and addresses with the records.

In the extrapolation used in this study, the number of taxfilers and properties is increased by the estimated increase in the number of taxfilers in Ontario between 1968 and 1972. In a similar fashion, income of each taxfiler is increased by the change in average income in Ontario between 1968 and 1972. The forecast used for 1972 was under-taken by the Ontario Treasury.⁶

Property taxes in 1968 are calculated by applying the 1968 mill rate for Guelph to the sum of assessment for land and improvements for each unit. Where applicable, the special farm mill rate is applied. The total rate for Guelph in 1968 was 27.7 mills. This included a mill rate of 16.3 for general purpose; 6.7 for elementary schools and 4.7 mills for secondary schools. The special farm rate in 1968 was 24.7 mills. In 1968 residential property was re-assessed at market values in Guelph. It is to this assessment roll that the 1968 mill rate is applied in the study as the purpose is to examine the incidence of property taxes in a situation where the discrepancy between assessed and market values is at a minimum. For the 1972 analysis, the study assumes the 1971 mill rate of 30.6 remains unchanged in 1972.

6. Canadian and Ontario Economic Forecast (Toronto: Department of Treasury and Economics, Fall, 1971).

Distributions by Age Group and Family Income

Tests for differences in the incidence of property taxes among age groups and for alternative definitions of income are possible within the Guelph analysis. The population of principal income recipients in each household is divided into three age groups: Those less than 35 years of age in 1968, those between 35 and 64 years of age and those 65 years of age and over. The incidence of property taxes and the average value of the property tax credit is examined for each group. The incidence of property taxes on the entire group of households is also examined for a more inclusive definition of household income; that is, where the name of more than one income taxfiler in the household also appears on the property assessment record, household income is the sum of these incomes.

III. APPLICATION OF THE PROGRAM TO THE ANALYSIS

The program has been developed and run on the FDP 10 of Dataline Systems, Toronto. The certain matches are stored on one reel of computer tape, the total set of matches, certain and doubtful, on two. The criteria by which income tax returns are selected for analysis are set within subroutine XTAX.

Analysis of Principal Income Recipients

XTAXA - Certain matches
XTAXB - Total matches

Accumulated (Family) Income

XTAXD - Certain matches
XTAXC - Total matches

The age group subset analyzed is also specified in subroutine XTAX. The extrapolation requires the setting of switch IEXTRP in subroutines, XTAX, XACUM and XADJ. The switch is set at "1" for 1968 and "2" for 1972.

The first experimental run of income tax data alone was made September 13, 1971. The first full run of income tax data alone, October 9 and the first full run of matched data November 30, 1971. The extrapolation was added January 16, 1972. The formule adopted for the Ontario Property Tax Credit Plan was first tested March 8, and the final runs were made May 8, 1972.

Appendix A

TABLES GENERATED

A.1 SUMMARY

The Guelph Analyzer program examines matched income tax returns and property assessment rolls for residents of the City of Guelph. The 1968 income tax returns for residents of Guelph were selected from the Master File of Ontario income tax returns. The Master File contains summary information for each tax return filed within Ontario. Residential properties in Guelph were re-assessed in 1968 at market value. Storage of the income tax and assessment data on computer tape made possible a matching of records which avoided the necessity of visual inspection. The computer program which matched the income and property tax data is described in Appendix G.

The Guelph Analyzer computes the incidence, and distribution of property taxes, the incidence of the combined income and property tax burden, and the implications of alternative formulae for the relief of the property tax burden. The model reads each matched record in sequence. Each record is checked to determine whether it fits the selection criteria of the particular run. Thus, the data may be analyzed by age group, family income, income of principal income recipient and so on.

A.2 TABLES

I GENERAL PARAMETERS

1. Run identifiers.

Location: Guelph
Run No.:
Run Year: (Year of data base or extrapolation)
Run Date:

2. Income tax rate schedules.

Old rate schedule
New rate schedule

3. Property tax classes (Up to 30 classes)

4. Income tax classes (Up to 30 classes)

5. Property tax credit assumptions.

Basic credit:
Credit as % property tax:
Credit as % assessment:
Credit as % income:
Maximum credit available:
Average assessment:

II GENERAL TABLES

The format of these tables provides for a matrix of results of up to 30 columns of property tax classes and of up to 30 rows of income classes.

1. Number of taxfilers
2. Total accumulated income
3. Average gross income
4. Average property tax paid
5. Average income taxes paid, old tax structure
6. Average taxes paid, new tax structure
7. Average disposable income, new tax structure
8. Average disposable income as a per cent of gross income, new tax structure.

9. Average property tax credit, new tax structure
10. Total accumulated income tax, old tax structure
11. Total accumulated income taxes, new tax structure
12. Total accumulated property tax credit, old tax structure.
13. Total accumulated property tax credit, new tax structure.

III SUMMARY TABLES

Summary tables classify the data by income class only.

1. Summary tax deduction data.

- (i) Total accumulated income
- (ii) Total accumulated deductions
- (iii) Total accumulated medical receipts
- (iv) Total accumulated donations

2. Summary tax exemption data.

- (i) Total accumulated personal exemptions, actual data.
- (ii) Total estimated personal exemptions, old tax structure.
- (iii) Total estimated personal exemptions, new tax structure.
- (iv) Average estimated exemptions, old tax structure.

3. Summary dependency data.

- (i) No. of children under 16.
- (ii) No. of children over 16.
- (iii) No. of taxfilers.
- (iv) No. of taxfilers filing as single.

4. Summary tax credit data.

- (i) Total credit, old tax structure.
- (ii) Average credit, old tax structure.
- (iii) Total credit, new tax structure.
- (iv) Average credit, new tax structure.

5. Summary tax data.

- (i) Total taxes, old tax structure.
- (ii) Average taxes, old tax structure.
- (iii) Total taxes, new tax structure.
- (iv) Average taxes, new tax structure.

6. Incidence of property tax credit.

- (i) Credit % gross income, old structure.
- (ii) Credit % income tax, old structure.
- (iii) Credit % gross income, new structure.
- (iv) Credit % income tax, new structure.

7. Incidence of income taxes.

- (i) Income tax % gross income, old structure.
- (ii) Income tax less credit % gross income, old structure.
- (iii) Income tax % gross income, new structure.
- (iv) Income tax less credit % gross income, new structure.

8. Dividends

- (i) Total dividends from taxable, Canadian companies.
- (ii) Old dividend tax credit.
- (iii) New dividend tax credit.

IV STATISTICAL SUMMARIES

- 1. Median property class by income class.
- 2. Median income class by property class.
- 3. Mean property tax by income class.
- 4. Standard deviation, property tax by income class.
- 5. Average disposable income - by property class, gross income less income taxes.
- 6. Standard deviation, average disposable income.
- 7. Average disposable income - by income class, gross income less income taxes.
- 8. Standard deviation, average disposable income.
- 9. Average disposable income -by income class, gross income less property and income taxes.
- 10. Standard deviation.
- 11. Average disposable income - by income class, gross income, less tax plus credit.
- 12. Standard deviation.

Appendix B

PROGRAM OUTLINE

B.1 SUMMARY

This appendix presents an outline of the important assumptions and procedures incorporated in the Guelph Analyzer. It presents the income tax rate schedule used in the old and new tax structures, the extrapolation procedure and the method used to derive dependency characteristics from reported levels of personal exemptions.

B.2 INCOME TAX STRUCTURES

The income tax schedules employed in estimating the income tax burden under the old and new tax structures are taken from: Clarkson, Gordon and Co., Tomorrows Taxes: An Analysis of 1971 Tax Reform Legislation as Contained in Bill C-259 (Toronto: Clarkson, Gordon and Co., August 1971) p.15. This schedule is reproduced as Appendix Table B.1. The 1971 rate schedule does not include the in-year tax reduction introduced by the federal and Ontario authorities. The analysis of the new tax system within a 1972 environment does not include the increase of the special old age exemption from \$650 to \$1,000 as introduced in the federal budget of May 8, 1972.

The analysis under the new tax act takes into account the major modifications to the tax base, the changed exemptions for married, single, and old people. It also takes into account the new dividend tax credit.

The analysis under the new tax act does not take into account: the standard employment expense allowance, the new treatment of top employee benefits, the deductibility of U.I.C. contributions, the taxation of U.I.C. benefits, the attribution to employees of employer medicare contributions, sickness and accident benefits from private plans, the inclusion of scholarship and fellowship income, and the special student allowances, as well as the changed definition of medical expenses. The analysis also excludes effects on the personal deductions due to the increase in the limit on contributions to registered pension plans and deferred profit sharing plans to \$2,500 from \$1,500.

The combined effect of all modifications to the tax base listed above, with the exception of the capital gains tax and the increased limits on contributions to registered pension plans, is tested for the aggregate Ontario situation in the model "PROVCRED".¹

1. Brian Hull, PROVCRED: Manual for the Analysis of the Revenue and Incidence Effects of Property and Sales Tax Credits in Ontario, op. cit., Appendix B.2

Table B.1

1971 AND 1972 PROPOSED RATES OF TAX APPLIED TO TAXABLE INCOME

Taxable income bracket		1971 (note 1)		1972 (note 2)	
		Tax on lower limit	Tax rate on excess	Tax on lower limit	Tax rate on excess
\$ 0	\$ 500	\$ 0	4.00 %	\$ 0	22.1 %
500	1,000	20	20.00	110	23.4
1,000	1,750	120	22.00	227	24.7
1,750	2,000	285	22.24	412	24.7
2,000	3,000	341	24.27	474	26.0
3,000	4,000	583	25.29	734	27.3
4,000	5,000	836	28.33	1,007	27.3
5,000	6,000	1,119	28.33	1,280	29.9

24,000	25,000	8,580	45.68	8,989	50.7
25,000	39,000	9,037	50.75	9,496	50.7
39,000	40,000	16,142	50.75	16,594	55.9
40,000	60,000	16,650	55.83	17,153	55.9
60,000	90,000	27,813	60.90	28,333	61.1
90,000	125,000	46,083	65.98	46,663	61.1
125,000	225,000	69,174	71.05	68,048	61.1
225,000	400,000	140,224	76.13	129,148	61.1
400,000	up	273,443	81.20	236,073	61.1

NOTES:

1. The 1971 tax schedule reflects the proposed reduction of the 3% surtax to 1½% (on tax in excess of \$200), includes the 4% old age security tax and the 2% social development tax (on taxable income in excess of \$1,000), and the revised rates proposed to be applicable to 1971 taxable incomes of less than \$3,000. It also includes provincial tax at 28% of federal basic tax.
2. The 1972 tax schedule includes provincial tax at 30% of federal tax.

B.3 EXTRAPOLATION PROCEDURE

The extrapolation of the analysis from the 1968 data base is undertaken with the very simplest possible procedure. The number of taxfilers between 1968 and 1972 increases at the level projected for Ontario in the GITAN analysis. The number of taxfilers in each income, dependency class cell is increased by this factor. Between 1968 and 1972 the number of taxfilers in Ontario is estimated to increase by slightly more than the national average.

Income in Ontario is assumed to change between 1968 and 1972 by a factor which adopts the forecast performance of the Ontario economy in 1972.¹ Taxable income in Ontario increases more rapidly than income itself and this is allowed for in the analysis.

	<u>1972/1968</u>
Increase in total income	1.44717
Increase in no. of taxfilers	1.18893

The extrapolation procedure for the economic environment used in this analysis is the same as that used in the Provincial Analyzer, "PROVCRED".

The mill rate applied to the re-assessed 1968 data is the actual rate for 1968 taxes. However, it should be noted the new

1. Canadian and Ontario Economic Forecast (Toronto: Department of Treasury and Economics, Fall, 1971).

Table B.2

OLD TAX SYSTEM

ESTIMATION OF FAMILY STRUCTURE FROM TOTAL
PERSONAL EXEMPTION CLAIMED

<u>Personal Exemption Claimed</u>	<u>No. of \$300 Exemptions</u>	<u>No. of \$550 Exemptions</u>	<u>Married or Single</u>
\$1,000	0	0	1
1,300	1	0	1
1,550	0	1	1
1,600	2	0	1
1,850	1	1	1
1,900	3	0	1
2,000	0	0	2
2,100	0	2	1
2,150	2	1	1
2,200	4	0	1
2,300	1	0	2
2,400	1	2	1
2,450	3	1	1
2,500	5	0	1
2,550	0	1	2
2,600	2	0	2
2,650	0	3	1
2,700	2	2	1
2,800	6	0	1
2,850	1	1	2
2,900	3	0	2
2,950	1	3	1
3,100	0	2	2
3,150	2	1	2
3,200	4	0	2
3,250	2	3	1
3,400	1	2	2
3,450	3	1	2
3,500	5	0	2
3,550	3	3	1
3,650	0	3	2
3,700	2	2	2
3,800	6	0	2
3,850	4	3	1
3,950	1	3	2
4,100	7	0	2
4,200	4	0	2
4,250	2	3	2
4,500	1	4	2
4,550	3	3	2

NOTE: 1 indicates single; 2 indicates married.
 Classification assumed: single exemption is
 \$1,000, married exemption is \$2,000.

assessment roll was not used until 1969.

Guelph mill rates:

1968	27.70
1969	28.90
1970	32.97
1971	30.60

Increase in the Guelph mill rate, 1971 over 1968 is 11.02 per cent. This is an implicit rate of change of 2.65 per cent per annum. The analysis assumes the 1971 mill rate was applicable in 1972.

B.4 TAXFILER DEPENDENCY CHARACTERISTICS

The dependency characteristics of each taxfiler are ascertained from the personal exemption level claimed. Each level of personal exemptions is a combination of various exemptions. The age of the taxfiler is on each return. A different schedule of exemptions applies to those under and over 70 years of age.

The exemption level for those under 70 years of age is shown in Table B.2. Thus, for example, if the level of personal exemptions does not exceed \$1,000, the taxfiler is filing as single with no dependants. Or if the personal exemption is greater than \$2,700 and no greater than \$2,800, then the taxfiler is filing as single with 6 children under 16 years of age.

The exemption level for those 70 years of age and over is shown in Table B.3.

Table B.3

OLD TAX SYSTEM

ESTIMATION OF FAMILY STRUCTURE
FOR TAXFILERS OVER 70 YEARS OLD.

	<u>No. of \$500 Exemptions</u>	<u>Married or Single</u>	<u>No. of \$300 Exemptions</u>	<u>No. of \$550 Exemptions</u>
\$1,000	0	1	0	0
1,300	0	1	1	0
1,500	1	1	0	0
1,800	1	1	1	0
1,850	0	1	1	1
2,000	0	2	0	0
2,050	1	1	0	1
2,150	0	1	2	0
2,300	0	2	1	0
2,500	1	2	0	0
2,650	1	1	2	1
2,800	1	2	1	0
2,900	1	1	1	2
3,000	2	2	0	0
3,200	1	1	2	2
3,300	2	2	1	0
3,550	2	2	0	1
3,850	2	2	1	1
4,700	2	2	2	2
5,000	2	2	3	2
5,700	2	2	3	3

Note: In married or single column: 1 indicates filing as single; 2 indicates filing as married. Classification is derived from total personal exemptions claimed. Under old tax structure single exemption is \$1,000; married exemption is \$2,000; and old age exemption for individuals 70 years old and older is \$500.

Appendix C

PROGRAM STRUCTURE

C.1 SUMMARY

Each run of the program is preceded by preparation of the datafile which is read in at the outset and initializes the parameters. The datafile contains the label to the run, the credit system selected, the date of the run, the size of the income and property class arrays, the specification of the credit formula, the levels of the various personal exemptions, the income classes and the average and marginal rates under the old and new tax structures.

The extrapolation switch must be set separately in sub-routines: TAXANL (XTAX in current version); ADJ (XADJ in current version; and ACCUM (XCUM in current version). The switch, IEXTRP, is set at 1 for analysis on a 1968 basis and 2 for analysis of the extrapolation to 1972.

The age group analyzed in the run is established with a statement in XTAX following the specification of IYOB = IYR. Thus, for example, an analysis of principal income earners of over 65 years of age requires the statement:

```
IF (IYOB. LE.69 AND.IYOB.GE.04) GO TO 92
```

The income characteristics of the household which are to be analyzed are assigned and the selection of the appropriate tax

returns for analysis is made in TAXANL. Normally this is for the tax return pertaining to the household with the largest gross income. However, it is also possible to accumulate all incomes pertaining to the address to learn the incidence of property tax on family income.

C.2 SUBROUTINE OUTLINE

MAIN: now XMAIN

Main program controls the parameter datafile read subroutine, the tax analysis system, and the table printing operations.

PARAM: now PARAM1

Reads parameter datafile.

TAXANL: now XTAX

Calls READIN, the subroutine which reads each tax record in sequence. TAXANL then assigns internal variable names to the read matrix. Next, the appropriate mill rate for the record is selected.

 If PCLAS = 1 residential mill rate
 If PCLAS = 2 special farm mill rate

The market value of the residential property is the sum of the value of the land and the improvements:

 BUILD = XLAND + BUILD

The value of the property tax is then the mill rate applied to the market value of the property:

 PROPT = MR* BUILD

TAXANL calls subroutines ADJ, RATESH, CREDIT and ACCUM.

It also selects the income characteristics of the tax return to be analyzed.

RDIN: now READTP

This subroutine reads each tax record in sequence and attaches variable names.

ADJ: now XADJ

This subroutine estimates family structure from the size of personal exemptions claimed. Personal exemptions under the new tax act are then calculated assuming the estimated family structure.

For modifications of the program up to August 1972 no allowance was made for the increase in deductions possible following the increase in the limit on contributions to registered pension plans and deferred profit sharing plans.

RSCH: Does rate schedule calculations.

CRED: now XCRED
Does tax credit calculations.

ACCUM: now XACUM
Accumulates data.

C.3 TAX CREDIT FORMULAE

The subroutine CRED is programmed for three alternative property tax credit formulae. The option to examine a sales tax credit formulae is included with one of these three forms. The desired formula for the property tax credit is specified by setting the switch NC in the datafile.

NC = 1

TAX CREDIT = BASIC CREDIT + a % PROPERTY TAX - b % TAXABLE INCOME.

If property tax is less than the basic credit, property tax equals the basic credit.

NC = 2

TAX CREDIT = BASIC CREDIT + a % PROPERTY TAX.

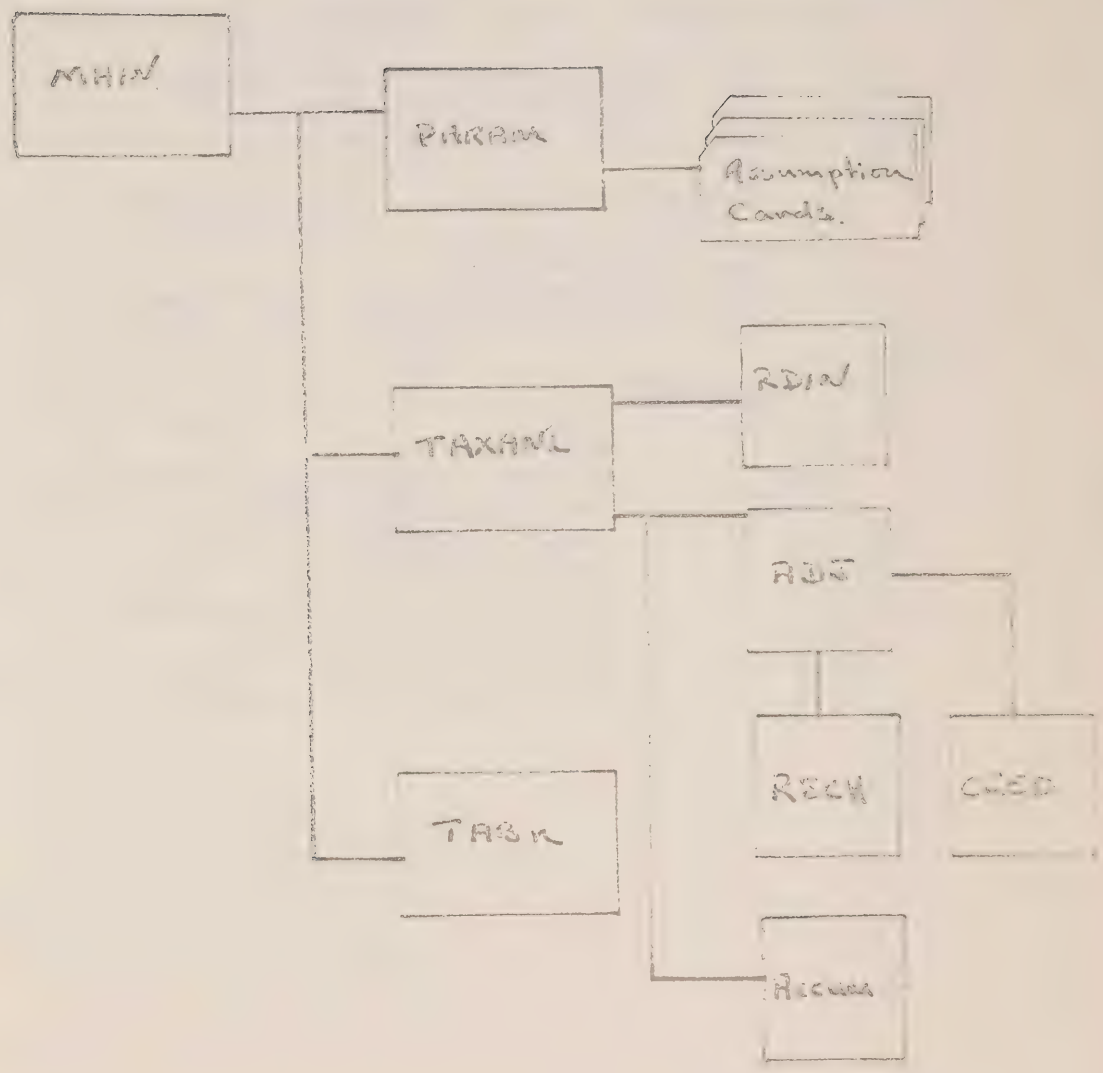

NC = 3

TAX CREDIT = BASIC CREDIT - a % TAXABLE INCOME.

If NC = 1 is chosen there is an option to select a sales tax credit formula. This is presently selected by removing a "GO TO" statement at the appropriate point in the CRED subroutine. The formula is \$10 per member of the family less 1 per cent of taxable income.

Aug. 10, 1961

FOOT - JHANT
PROGRAM ANALYSIS

August 10, 1971.

C.4 DETAILED DOCUMENTATION

PROPOSED SUBROUTINES

Basic program outline:

Main program: which controls

- (a) Read parameters subroutine
- (b) Do tax analysis subroutine
- (c) Table printing operations

Tax analysis subroutine: which controls

- (a) Read records
- (b) perform operations (i) rate schedule (ii) credit
- (c) accumulate data

Program names:

MAIN	:	main program
PARAM	:	program control and parameters
TAXANL	:	tax analysis control
RDIN	:	reads records
ADJ	:	basic calculations
RSCH	:	rate schedule calculations
CRED	:	credit calculations
ACCUM	:	accumulates data
TAB _{<u>n</u>}	:	table numbers, 1 to n.

August 10, 1971.

PROPERTY AND INCOME TAX ANALYZER

INPUT RECORD VARIABLES

<u>NAME</u>	<u>LABEL</u>
Identification characteristics	
Assessment number	LØC
Birth year	IYØB
Sample code	SAM
Income tax characteristics	
Income:	
Prior year loss	XLØS
Gross main source income	XINC
Foreign income	XFØR
Net dividends from taxable Cdn. companies	XDIV
Total income	XTØT
Deductions and exemptions:	
Deductions to total income	DED
Gross medical receipts	XMD
Donations	DØN
Personal exemptions	EXEMP
Taxable income:	
Taxable income	TAXI
Federal tax	FTAX
Provincial tax	PTAX
Foreign tax paid	FØRT
Federal foreign tax credit	FFTX
Provincial foreign tax credit	PFTX
Tax deducted at source	STAX
Tax adjustments	TADJ
Amount paid on filing	PAID
Computer calculated balance	CMBAL
Identification characteristics	
Sinno	SINNØ
Surname	SUR
First name	FNAME
Street address	ADD
Property tax data	
Assessment	ASS
Property class	PKLAS
Property tax payable	PRØPT

VARIABLE NAMES

LABEL

NAME

INPT, INPT1	input device code
IPOUT	output device code
K1	number of income classes
K2	number of property classes
K3	number of rate schedule classes (old tax schedule)
K4	number of rate schedules
K5	number of rate schedule classes (new tax schedule)
ARSH(i, j)	average rate of tax in class
BRSH(i, j)	bottom of tax class
RSH(i, j)	marginal rate of class
BCRED	basic property tax
CRED	credit as % of property tax
ACRED	credit as a % of assessment
XINCP	credit as % of income
CMAK	maximum credit available
AMAS	average municipal assessment level or per capita credit
EXEMS(j)	single person exemption
EXEM(j)	married exemption
EXA	old age exemption
CH1	children under 16
CH2	children 16 and over
ECH1	exemption children under 16
ECH2	exemption children 16 and over
EXE	employment expenses
XK(K1)	gross income classes (lower limit of class)
TXK(K1)	income class threshold levels
PKLAS(K2)	property classes (lower limit of class)
TP(K2)	property class threshold levels
SM(i, j)	summary classes

August 26, 1971.

ADDED VARIABLES

PROGRAM CONTROL

N1	=	record counter
NN	=	number of records
NC	=	credit type
INPT1	=	input device code for record file

ACCUMULATION ARRAY

Variables to be accumulated by income class, where

i = income class, j = variable name.

<u>RECORD LABEL</u>	<u>ARRAY LABEL</u>	<u>NAME</u>
XTØT	SM (i,1)	Total income
DED	SM (i,2)	Deductions to income
XMD	SM (i,3)	Gross medical receipts
DØN	SM (i,4)	Donations
EXEMP	SM (i,5)	Personal exemptions
SN	SM (i,6)	Est. exemptions, new
SØ	SM (i,7)	Est. exemptions, old
TAXI	SM (i,8)	Taxable income
ØTAX	SM (i,9)	Est. taxable, old
NTAX	SM (i,10)	Est. taxable, new
FTAX	SM (i,11)	Federal tax
P TAX	SM (i,12)	Provincial tax
FF TX	SM (i,13)	Fed. for tax credit
PF TX	SM (i,14)	Prov. for tax credit
TXØ	SM (i,15)	Est. tax, old
TXN	SM (i,16)	Est. tax, new
CDØ	SM (i,17)	Est. prop. credit, old
CDN	SM (i,18)	Est. prop. credit, new
PRØPT	SM (i,19)	Property tax payable
ASS	SM (i,20)	Assessment
	SM (i,21)	Numbers of filers
CH1	SM (i,22)	Number of children under 16
CH2	SM (i,23)	Number of children 16 and over
If MSTA = 1	SM (i,24)	Singles
If MSTA = 2	SM (i,25)	Marrieds

August 27, 1971.

ADDED VARIABLES

ANALYSIS

MSTA	=	Marital status, 1 if single, 2 if married.
KCH	=	Excess estimated children counter
DIFF	=	Record exemption less \$1000.00
TXY	=	Taxable income, common term
ØTAX	=	Taxable income, estimated, old system
NTAX	=	Taxable income, estimated, new system
TXØ	=	Tax payable, old system
TXN	=	Tax payable, new system
CDØ	=	Property tax credit, old system
CDN	=	Property tax credit, new system

August 27, 1971.

ACCUMULATION ARRAY

Variables to be accumulated by income and property class, where IJ = income class, IK = property class.

<u>RECORD LABEL</u>	<u>ARRAY LABEL</u>	<u>NAME</u>
ØTAX	SØTAX(IJ,IK)	Taxable Income old system
NTAX	SNTAX(IJ,IK)	Taxable Income new system
CDØ	SCDØ(IJ,IK)	Property credit, old system
CDN	SCDN(IJ,IK)	Property credit, new system
SN1	SN1(IJ,IK)	Record counter
XTØT	STØT(IJ,IK)	Total income
PRØPT	SPRØP(IJ,IK)	Total property tax
TXØ	STXØ(IJ,IK)	Income tax payable, old system
TXN	STXN(IJ,IK)	Income tax payable, new system.

TABLES, PROPERTY

Sept. 28/71

TAX ANALYSIS

TAB 1

1. Number of tax filers in each property class.
2. Total income in each property class.
3. Average gross income in each property class.
4. Average property tax paid in each class.

TAB 2

1. Average taxes paid, old tax structure.
2. Average taxes paid, new tax structure.
3. Difference in taxes (average).
4. Average property tax credit, old structure.
5. Average property tax credit, new structure.

TAB 3

1. Total taxes, old system (excl. prop. taxes)
2. Total taxes, new system (excl. prop. taxes)
3. Total property tax credit (old system)
4. Total property tax credit (new system)

TAB 4

1. Summary tax deduction data.
 - (a) income class
 - (b) total income
 - (c) deductions
 - (d) medical receipts
 - (e) donations
2. Summary tax exemption data.
 - (a) personal exemptions
 - (b) estimated exemptions, old tax structure
 - (c) estimated exemptions, new tax structure
 - (d) average exemptions, old tax structure
3. Summary dependency data.
 - (a) number of children under 16
 - (b) number of children over 16
4. Summary tax credit data.
 - (a) total credit, old tax structure
 - (b) average credit, new tax structure
 - (c) total credit, new tax structure
 - (d) average credit, new tax structure

TAB 5

1. Summary tax data.
 - (a) Taxes (excl. credit), old structure
 - (b) Average taxes, old structure
 - (c) Taxes (excl. credit), new structure
 - (d) Average taxes, new structure

2. Incidence tables of credit.
 - (a) Credit as % gross income.
 - (b) Credit as to taxes (excl credit), old structure.
 - (c) Credit as % gross income, new structure.
 - (d) Credit as % taxes (excl. credit), new structure.

3. Incidence tables of taxes.
 - (a) Taxes (excl. credit) as % gross income, old structure.
 - (b) Taxes, with credit as % gross income, old structure.
 - (c) Taxes (excl. credit) as % gross income, new structure.
 - (d) Taxes, with credit as % gross income, new structure.

4. Not used.

Appendix D

PARAMETER DATAFILE

The parameter datafile has the following format:

LINE 1: RNYR: Base year 1968 or extrapolation 1972.
RN: Run number.
LOC: Location of analysis.

LINE 2: NC: Credit form.

LINE 3: D1: Day of run.
D2: Year of run.
DT: Month of run.

LINE 4: K1: No. of gross income classes.
K2: No. of property tax classes.
K3: No. of income classes, old rate schedule.
K4: No. of rate schedules.
K5: No. of income classes, new rate schedule.

LINE 5: BCRED: Basic credit
CRED: % property tax added to basic.
ACRED: % assessment (not used).
XINCP: % taxable income subtracted from credit.
CMAX: Maximum credit.
AMAS: Average assessment (not used).

LINE 6: EXEMS (1): Single exemption, old structure.
EXEMS (2): Single exemption, new structure.
EXEM (1): Married exemption, old structure.
EXEM (2): Married exemption, new structure.

LINE 7: CH1: (not used).
CH2: (not used).
ECH1: children under 16 exemption.
ECH2: children 16 and over exemption.

LINE 8: ARSH (1,J): Average rate schedule, old structure.

LINE 9: ARSH (2,J): Average rate schedule, new structure.

LINE 10: BRSH (1,J): Taxable income threshold, old structure.

LINE 11: BRSH (2,J): Taxable income threshold, new structure.

LINE 12: RSH (1,J): Marginal tax rate, old schedule.

LINE 13: RSH (2,J): Marginal tax rate, new schedule.

LINE 14,15: SC, TXK: Income classes (both identical, one now
redundant).

LINE 16,17: PKLAS, TP: Property tax classes (both identical, one
now redundant).

Appendix G

GUELPH MATCHING PROGRAM

Harry Newton

November 1, 1971

The following pages present a description of the above-mentioned program, including the assumptions made and the steps taken in writing the program, and the problems encountered in testing the program.

I. Introduction to the Matching Programs

1. This program takes the property tax records of the residents of Guelph and tries to match them with their personal income tax records.
2. The only pieces of information that are common to both the property tax tapes and the personal income tax tapes are names and addresses. The names and addresses appear in full on the property tax records, but on the personal income tax records, only the first ten letters of the surname and the first five letters of the given name appear. Hence, the sole criteria for a match are the names and the addresses.
3. A certain match is defined as a property tax record and a personal income tax record with
 - i) identical surnames (first ten letters),
 - ii) identical addresses (house no. and street name),
 - and iii) the given name on the personal income tax record is identical to one of the given names on the property tax record (first five letters).
4. A doubtful or possible match is defined as a property tax record and a personal income tax record with
 - i) identical surnames,
 - ii) identical addresses, and
 - iii) different given names.

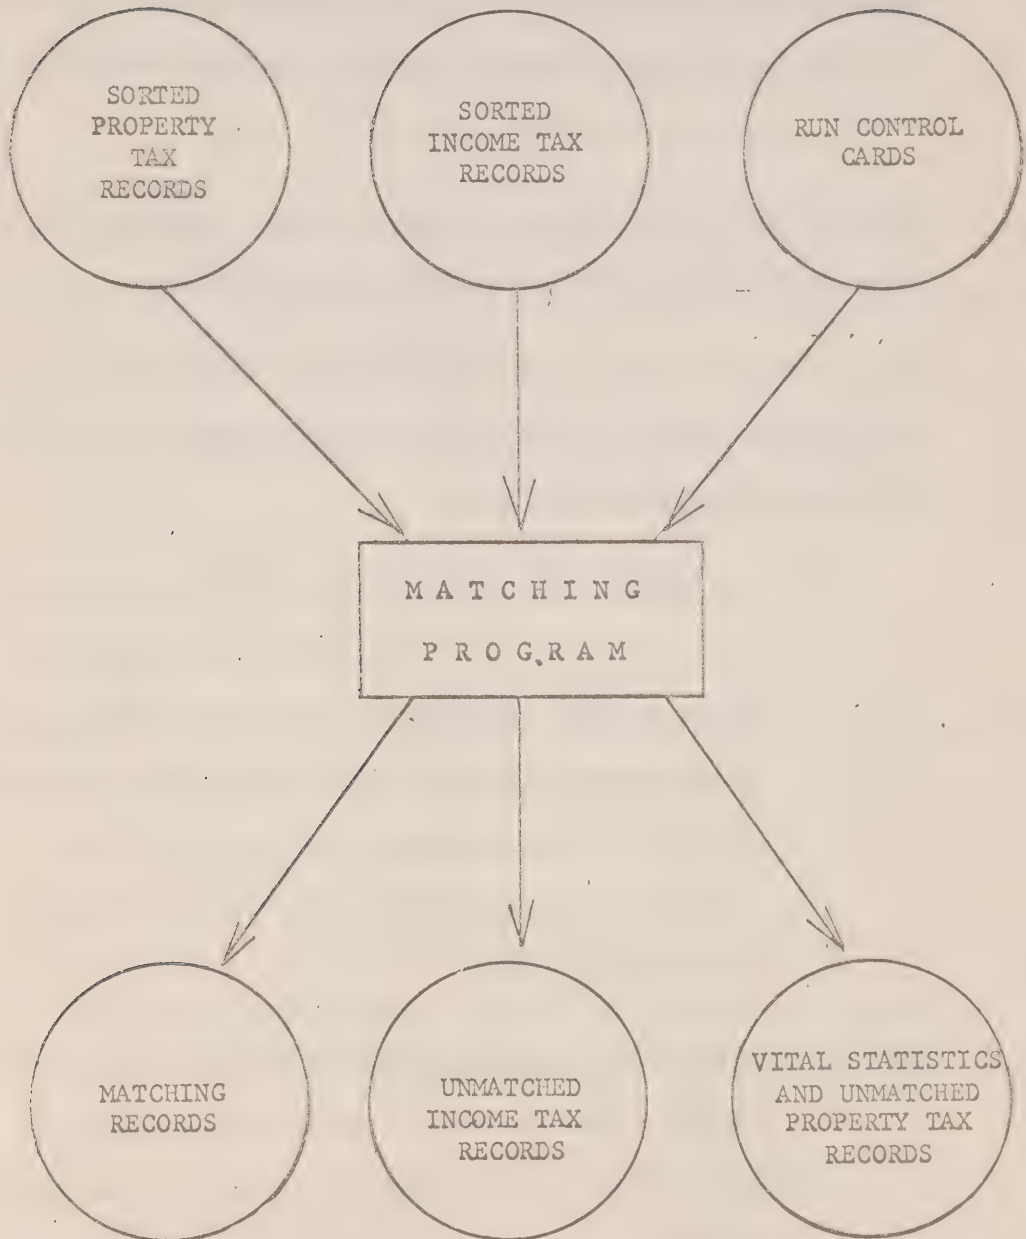

5. Doubtful matches are important for the following reasons:

i) the possibility that the husband is the only income taxfiler in the family, but the property is in the wife's name, or vice versa.

ii) the possibility that more than one (or more than two) members of the family are income taxfilers. For instance, a husband and wife, both whom are listed on the property tax record, may both be income taxfilers. In addition, other members of the family, who are not listed on the property tax record, may also file income tax returns. In this case, doubtful matches will be useful to the user who is trying to calculate total income of a particular family. Also, the user may wish to compare the incomes of the various members of the family.

6. Given the above definitions, one can now set to devise an algorithmic procedure to search for these matches.

General Flowchart of the Program

II. Preparation of Input Tapes

1. The property tax records were sorted alphabetically by the surname and then by the given name of the first assessed person on the record.
2. The personal income tax records were sorted alphabetically by the surname and then by the given name of the taxfiler.
3. In preparing an input tape of property tax records for the program, the following changes were made to the data tapes supplied by the Department of Municipal Affairs.

- i) The name of the last ten assessed persons on each record were deleted. Generally, this space was blank anyway. The names of the first five assessed persons were retained but only the first two names are used in the program.
- ii) All of the data pertaining to property dimensions was deleted.

NOTE: The above two steps permitted the property tax record to be shortened considerably (from 645 characters to 265 characters). The subsequent saving of tape space is obvious.

- iii) Each record was lengthened by 11 characters to 276 characters by adding eight blanks at the end of the record.

- iv) Only property tax records pertaining to non-vacant residential properties were retained.
Those pertaining to other categories were deleted.
 - v) A key was placed at the beginning of the record to indicate whether the assessed person(s) owned (O) or rented (R) the property.
4. In preparing an input tape of personal income tax records for the program, the following changes were made to the data tapes supplied by the Department of Revenue.
- i) Each record was lengthened by nine characters (from 315) to 324 characters by adding nine blanks at the end of the record.
 - ii) No further changes.
5. All of the steps mentioned above were performed on the IBM 360/40 which was resident at the Computer Services Centre (hereafter referred to as CSC) until October 1, 1971.
6. As of October 1, 1971, it was necessary to convert both input tapes (property tax and personal income tax) for use on the UNIVAC 1108 at CSC. The conversion program created two tapes with the following characteristics:
- i) COBOL format
 - ii) 9 - track
 - iii) Standard labels
 - iv) Property tax tape - blocking factor - 10
- 46 words per record

- v) Personal income tax tape - blocking factor - 50
- 54 words per record

NOTE: Since each word contains six characters, one can see why both records had to be lengthened:

$$\begin{array}{rcl} 6 \times 46 & = & 276 \\ 6 \times 54 & = & 324 \end{array}$$

7. The COBOL formatted tapes were created in Fortran-callable, COBOL File Handler subroutine, ØGFIØC. This subroutine is part of the system library at CSC, and a description of how to use it is available from CSC or from anyone who has used it.

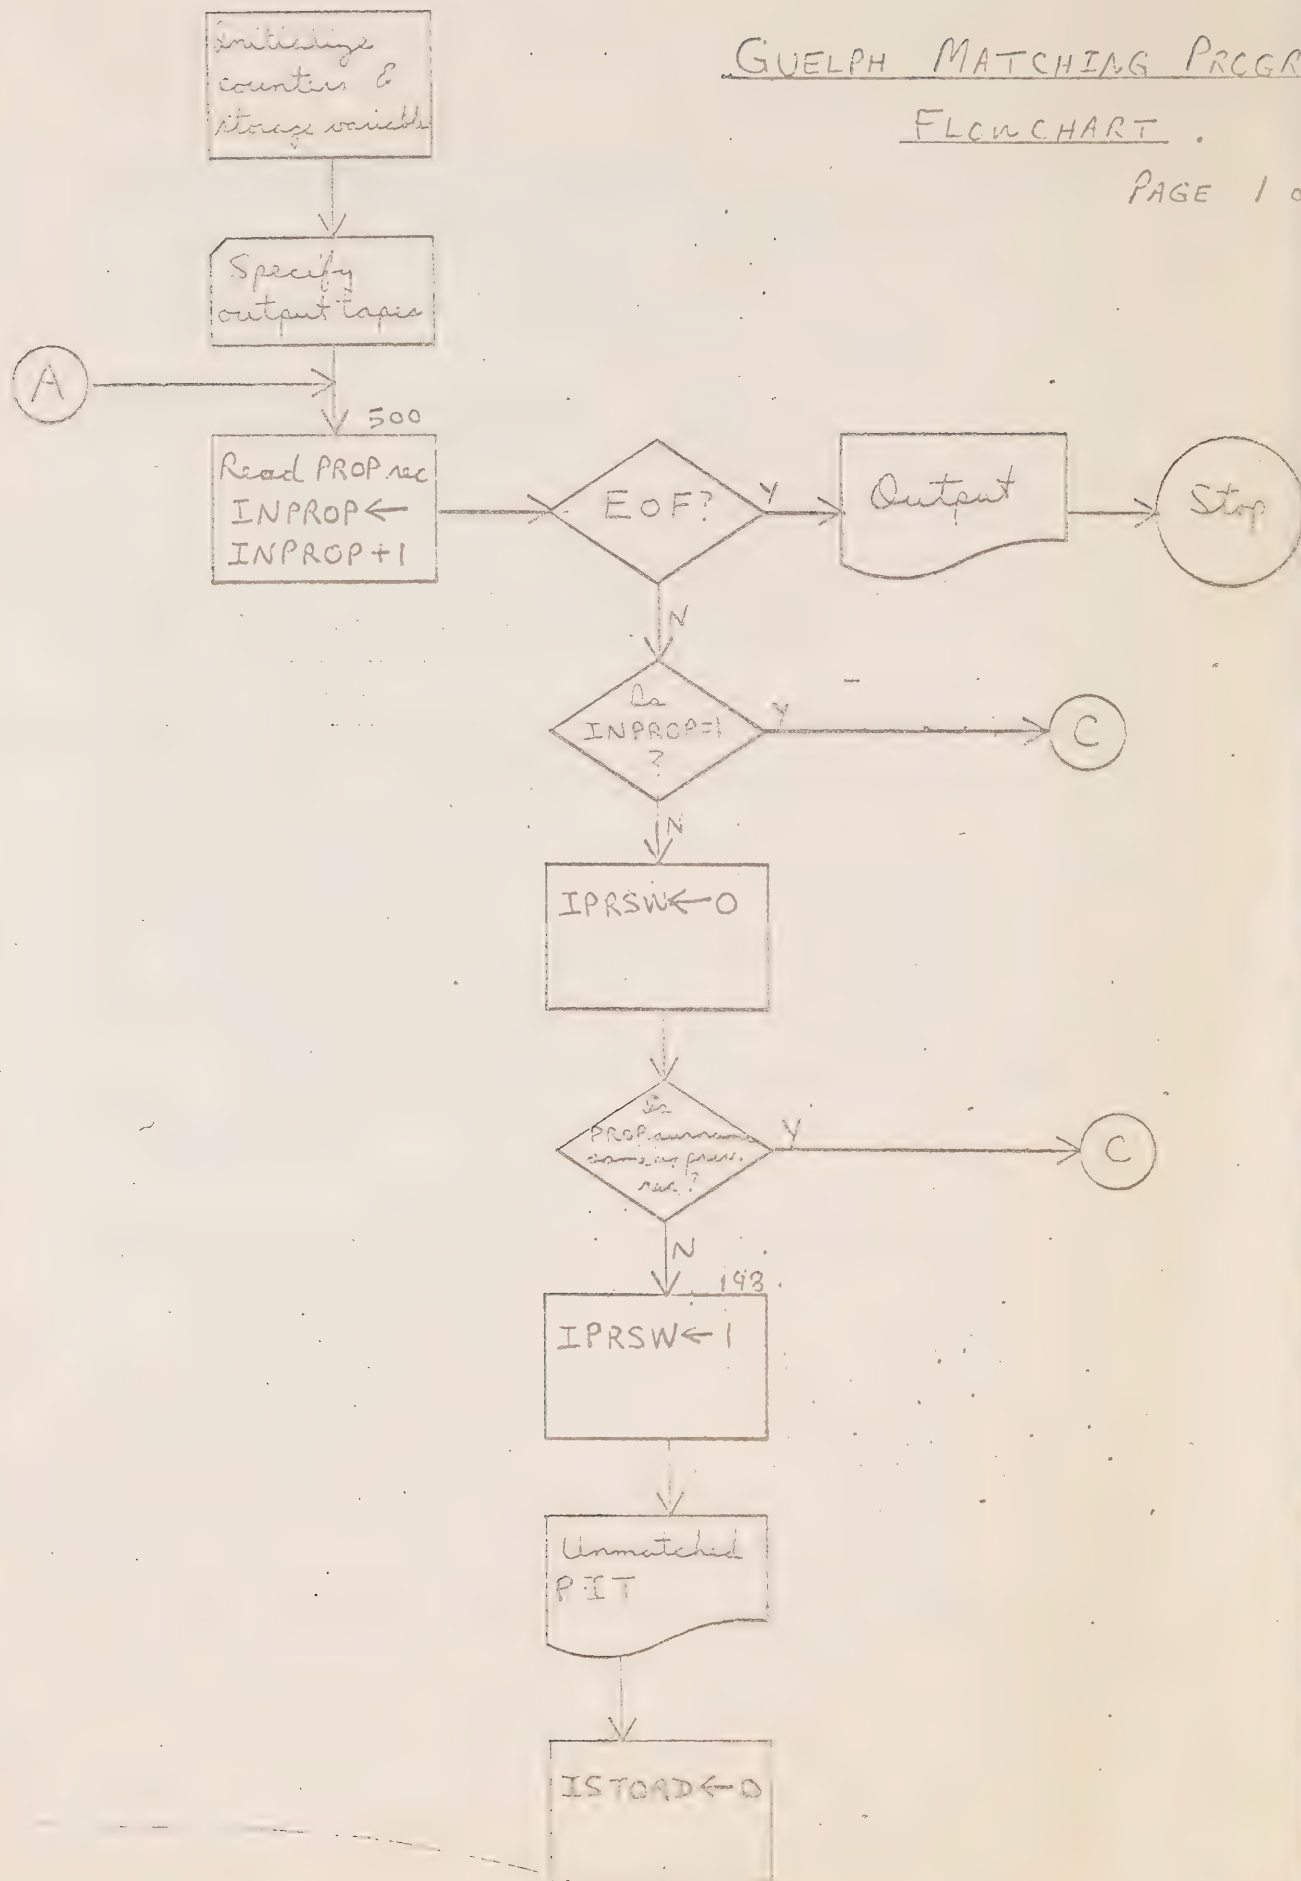

III. The Program Itself

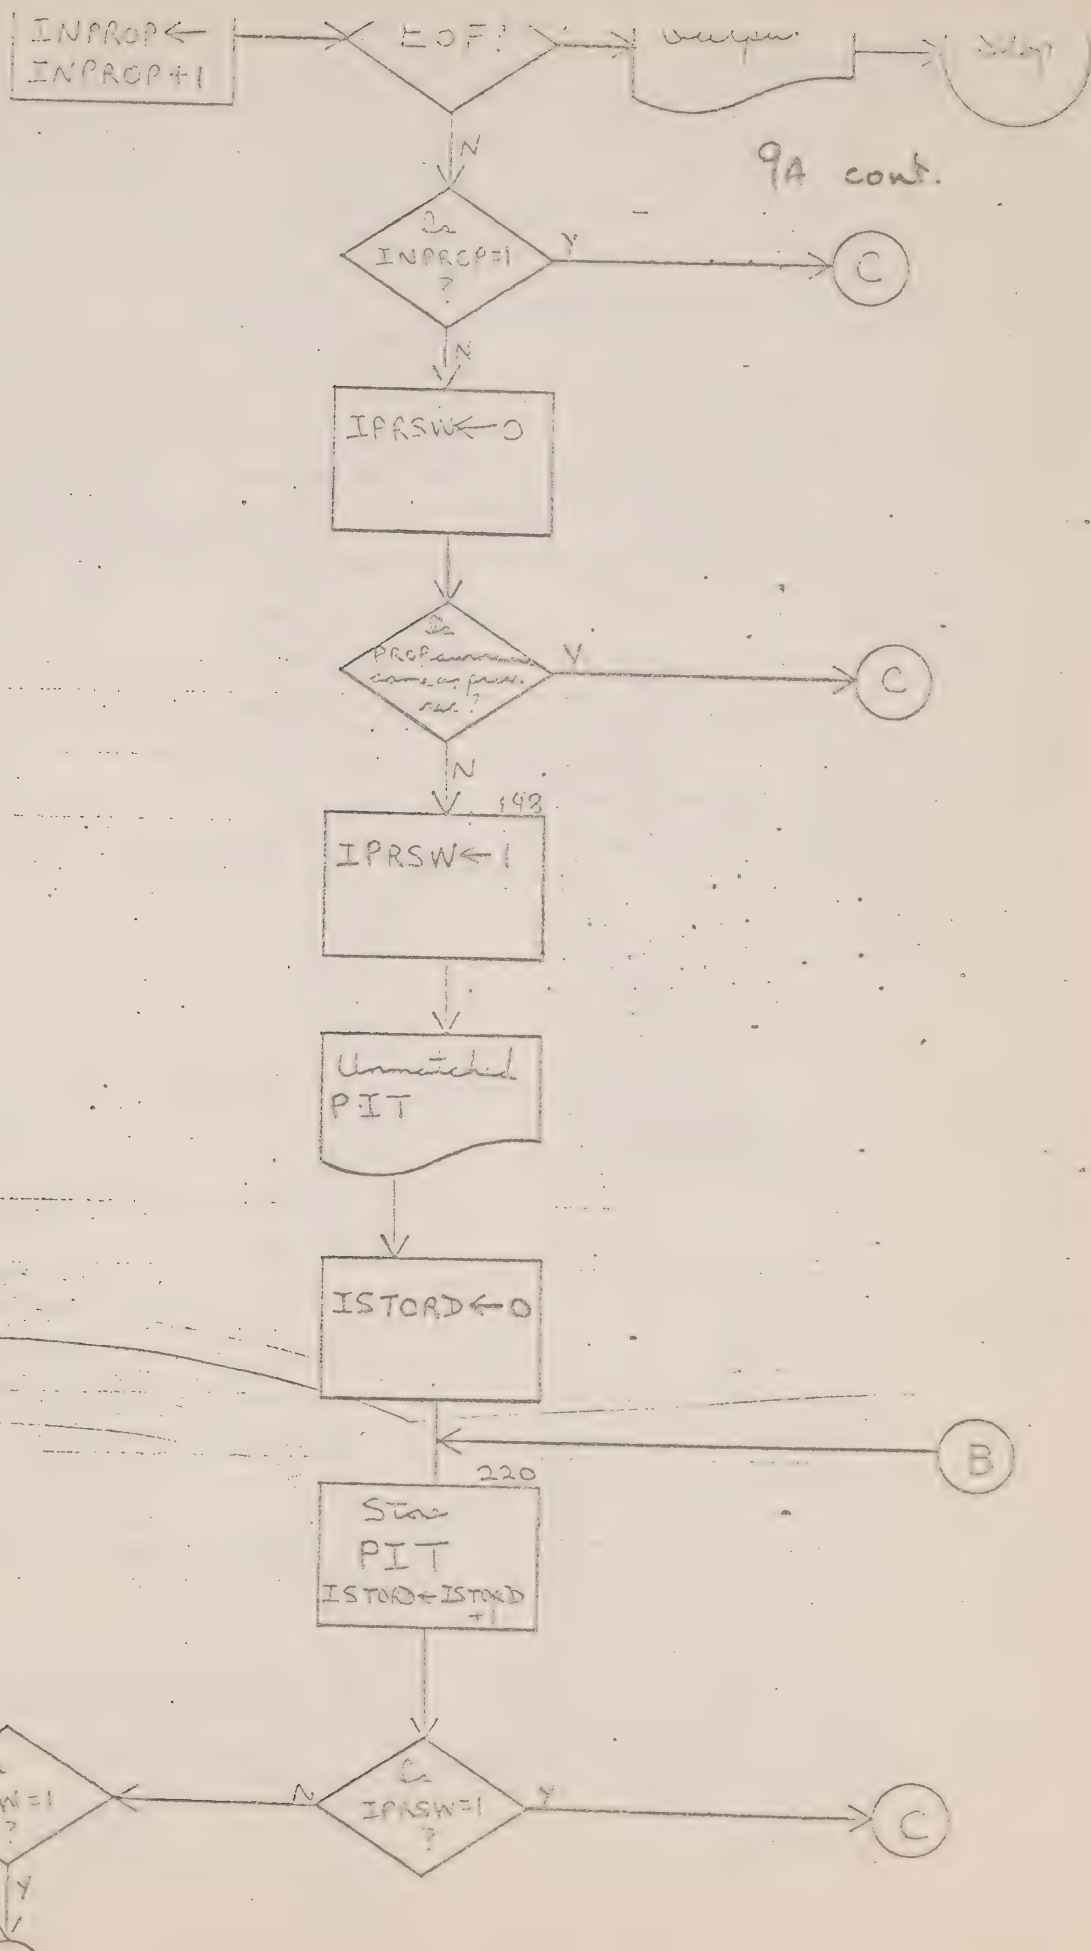

1. Input - the two tapes described in Part II. There are approximately 15,000 property tax records and 28,000 income tax records.
2. The Matching Procedure - Basically, the program takes a property record and tries to find an income tax record with identical names and addresses. More specifically, the program reads in a property tax record and then an income tax record. If the surname on the income tax record precedes (alphabetically) the surname on the property tax record, then it is assumed that there will be no match for this income tax record. Income tax records are read in until the surname on the income tax record is identical or exceeds the surname on the property tax record. In this case, the income tax record is stored. If the surnames are identical, addresses are compared. If addresses match, then given names are compared. Doubtful and certain matches are written on tape. If the surname on the income tax record exceeds the surname on the property tax record, another property tax record is read in. Now, records that were stored earlier in the program are compared and the same comparison criteria as above are applied to the records. After the stored records are exhausted, more income tax records are read from the input tape. Whenever, the surname on an income tax record precedes the surname on the property tax record, the income tax record is deleted from storage. All income tax records that cannot be matched are written on tape. The entire procedure continues until one of the tapes reaches an end of file.

3. The above description is by no means a thorough description of the matching procedure but is merely an attempt to outline the important steps in the program.
4. Output = from the line printer.
 - a) "vital statistics" (i.e. no. of records read, no. of records written)
 - b) all unmatched property tax records.
5. Output - on tape. All certain and doubtful matches are written on one tape. They are coded so as to be distinguishable. Also, on a second tape, all unmatched personal income tax records are written.
6. The output tapes created on the UNIVAC 1108 can be adapted to the -PDP-10 (Dateline) with minimal problems. Both tapes were created using the I/Ø routine NTRAN, which is available in the system library of both machines.
7. Both output tapes possess the following characteristics:
 - i) written by NTRAN
 - ii) 7 - track
 - iii) unlabelled
 - iv) blocking factor - 10
 - v) Matched record is 208 words long.
 - vi) Unmatched income tax record is 87 words long.

Description of Important Variables and Flags
In the Program

KSW has the value

- 0 when a PIT record is to be read from storage.
- 1 when a PIT record is to be read from the input tape.

LSW has the value

- 0 when the surname on the PIT record does not match the surname on the property tax record. --
- 1 when these surnames do match.

IPRSW has the value

- 0 when the surname on the property record is the same as the surname on the previous property tax record.
- 1 when these surnames are different.

MSW has the value

- '0' for the first match of a PIT record with a property tax record, and
- '1' for any subsequent match of a PIT record with the same property tax record.

LCCE has the value

- 'C' and indicates a certain match.

LDEE has the value

- 'D' and indicates a doubtful or possible match.

MSTATJ has the value

'1' when the name on the PIT record matches the first name on the property tax record.

'2' when the name on the PIT record matches the second name on the property tax record.

ISTORD is the number of records currently in storage.

KSTORD is a pointer indicating the record that is being read from storage.

INPROP is the number of property tax records that have been read from the input tape.

INPIT is the number of PIT records that have been read from the input tape.

ICERT is the number of certain matches that have been found.

IDOUBT is the number of doubtful matches that have been found.

LERR has the value

0 until end of file on the PIT input tape is reached,
and

1 when end of file is reached.

KERR has the value

0 until end of file on the property tax input tape is reached,
and

1 when end of file is reached.

V. Description of Output Record

1. KEY #1 - The first word in the output record indicates whether the matches is a certain or a doubtful match. It is coded C or D respectively.
2. KEY #2 - The second word contains the label 0 (Zero) if this is the first match of a personal income tax record and the property tax record, or 1 if this is a subsequent match of a different personal income tax record with the same property tax record.
3. KEY #3 - The third word contains the label 1 if the name on the personal income tax record matches the first surname on the property tax record, or 2 if the name on the personal income tax record matches the second surname on the property tax record.
4. KEY #4 - The fourth word indicates whether the property is owned or rented by the person(s) mentioned on the property tax record. It is coded Ø or R respectively. This piece of data is not too reliable since the record selection procedure used by the programmers in the preparation of the input tape may have underestimated the number of properties rented. This does not affect the matching procedure in any way.
5. Words 5 - 121 are property tax record data.
6. Words 122 - 208 are income tax record data.

7. The following is a breakdown of the components of a matching record. The output vector is called MATCH, and has 208 components.

GUELPH MATCHED RECORDS

MATCH

174-78	5	5A1	246-250	FNAME	First name
179-208	30	30A1	251-280	ADD	Street Address

-
- * For these six variables, the last location for each variable is overpunched to indicate the sign (+ or -). After conversion of these variables (use subroutine NUMCOM), the entire variable will be stored in the underlined location.

VI.. Limitations of the Program

Visual examination of tape dumps of the two input tapes reveals that in a very small number of cases, the program did not match records which should have been matched:

1. First, consider the case of a property tax record containing two different surnames, say JONES AND SMITH. This record will be sorted among the property records starting with the letter J. The program may be able to find an income tax which will match JONES, but will not look for an income tax record which will match SMITH. To search for an income tax record for SMITH at this point would require excessive C.P.U. time and core. Hence, anytime that a property tax record contains two different surnames, it is unlikely that the program will search for an income tax record which matches the second surname.
2. Second, names and addresses may be misspelled or misread by those persons who prepare the data. The following are examples:
 - i) Missing punctuation: O'BRIEN may be lacking its apostrophe.
 - ii) Names that are not pronounced in English the way they are spelled: certain European names.
 - iii) Names that can be spelled many ways: SHEPHERD, SHEPHARD, SHEPPARD, etc.
 - iv) Errors in addresses
 - v) A name like MACDONALD may appear as two words, i.e. MAC DONALD.

3. This program does not have the capacity to determine whether a name is spelled correctly. Hence, any match involving misprinted input data which may be obvious to the human eye is rejected immediately by the computer.

If the user should wish to try to obtain more matches by visual means, the print out of the unmatched property tax records and the tape dump of the unmatched income tax records are available for this purpose.

This program is not a general matching program. It was written to handle specific data under specific conditions. Hence, anyone wishing to design a program to perform a matching procedure should take note of the specialized nature of this program.

Reading in the Matched Records

Input records are read from the input tape ten at a time. However, the user will want to analyze each record individually. Hence, the following statements will serve as a suggested means of doing this:

```
COMMON etc.  
DATA NRIN/0/, IEND/0/ etc.  
  
20 CALL READTP  
DO 100 I = 1, 10  
CALL ATTACH (I)  
  
      ^  
      Insert FORTAN statements which  
      analyze each record  
  
100 CONTINUE  
IF (IEND.NE.I) GO TO 20  
  
Program continues on end-of-file  
  
STOP  
END
```

Subroutine READIN performs the following operations each time it is called.

- i) checks for end-of-file
- ii) reads in a block of ten records
- iii) checks for unreadable records
- iv) increments record counter by 10
- v) converts overpunched characters to numeric form
(calls NUMCON)
- iv) returns to calling program.

GUELPH MATCHING PROGRAM - NEW OUTPUT TAPE

The output tapes from the Guelph Matching Program are not completely readable at Dateline. All numeric data can be read on the PDP-10, but literal data cannot be read. In other words, all data pertaining to money can be read, but information such as names and addresses cannot be read. Hence, a new tape has been created on the UNIVAC 1108 using NTRAN. This tape contains only certain matches, and possess the following characteristics:

- i) 7-track
- ii) unlabelled
- iii) blocking factor - 10
- iv) record length - 208 words
- v) MATCH (1) = 1 (not 'C') for all records
- vi) MATCH (2) = 1 instead of '0'
or 2 instead of '1'
- vii) MATCH (3) = 1 instead of '1'
or 2 instead of '2'
- viii) MATCH (4) = 1 instead of 'Ø'
or 2 instead of 'R'
- ix) MATCH (18) = 1 instead of 'RBSU'
or 2 instead of 'FBSU'
or 3 for all other property classes.
- x) All overpunched characters have been converted using subroutine NUMCØN.

NOTE: Please refer to the description of the output record in the documentation to the program.

Subroutine ATTACH with argument I attaches program variable
names to the appropriate elements of the ith record of the input block
of records. The program variable names are contained in COMMON statements.
This subroutine is readily alterable according to the data requirements
of the user.

Program file READTP contains the three subroutines
READIN, ATTACH, and NUMCØN.

The following items are still unreadable on the PDP-10.

MATCH (11)	-	MATCH (14)
MATCH (29)	-	MATCH (121)
MATCH (139)	-	MATCH (142)
MATCH (161)	-	MATCH (170)
MATCH (174)	-	MATCH (208)

However, it is not expected that they will enter into the analysis.

The user is reminded that the overpunched characters appearing in the income tax section of the output record have already been converted. Hence subroutine NUMCON will not be called by READIN.

Appendix H

NUMERIC CONVERSION

Helmut Giese

September 21, 1971

This is a sub-routine in the Guelph Analyzer which converts a
Cobol formatted sign to a Fortran integer.

FUNCTION NUMCON (NUM, ID, NREC, INREC, IPRINT)

This function ^{takes} ~~accepts~~ a cobol sign formatted number and converts it to a Fortran integer.

Input: NUM is the integer portion of the number (in 10's)

ID is the sign-carrying digit (making it an alphabetic character)

NREC is the record number on which NUM and ID are located

INREC is a counter to aid in the location on the record of an ID - field containing a character not recognized for conversion

IPRINT is the logical unit number on which error messages are written.

Note: 1) Any one or all of NREC, INREC, IPRINT maybe set to zero to leave out part of the identification of an ID - field containing an unrecognizable character.

If IPRINT = 0 , no error message is given.

2) If ID contains a character not recognized in the conversion, then

2.1 NUMCON = + 10 * NUM

2.2 A message is written on Unit[#] IPRINT.

3) Characters recognized for conversion are

3.1 - the digits 0 to 9

3.2 - the letters A to R

3.3 - blanks, and the fields 12-0 and 1/0
